Description:
Abstract:
Crop Sequence Boundaries (CSB) is a vector-based geospatial dataset which are fully synthetic representations of agricultural fields, their acreage, and cropping rotation history. These new data are primarily derived from a historical stack of Cropland Data Layers over a set time frame based on an algorithm of geospatial functions. It was developed in cooperation with the Economic Research Service.

Purpose:
Crop Sequence Boundaries (CSB) are geospatial algorithm-based field polygons derived from the NASS Cropland Data Layer (CDL). The growth of gridded datasets has fostered applications that require analysis units for aggregating the data to an attribute table. CSBs are created to provide full coverage for the 48 contiguous United States and to be accurate and repeatable across years. CSBs use a specified time frame of historic CDLs, together with road and rail networks, to capture the crop sequence in these synthetic fields. The current archive of these datasets span 8-year time frames for all years from 2008 to 2025.

Data_Quality_Information:
Attribute_Accuracy:
Attribute_Accuracy_Report:
The accuracy of the crop types identified within the CSB at the field-level are dependent upon the accuracy of the Cropland Data Layer (CDL). Detailed accuracy reports for the CDL are available within the official metadata at <https://www.nass.usda.gov/Research_and_Science/Cropland/metadata/meta.php>.

Quantitative_Attribute_Accuracy_Assessment:
Attribute_Accuracy_Value:
Classification accuracy for the CDL is generally 85% to 95% correct for the major crop-specific land cover categories.

Attribute_Accuracy_Explanation:
Detailed accuracy reports are available within the official CDL metadata at <https://www.nass.usda.gov/Research_and_Science/Cropland/metadata/meta.php>

Logical_Consistency_Report:
The CSB are primarily derived from historical Cropland Data Layers (CDLs) over a set time frame based on an algorithm of geospatial functions. The CDL is produced using training and independent validation data from the Farm Service Agency (FSA) Common Land Unit (CLU) Program and United States Geological Survey (USGS) National Land Cover Database (NLCD). More information about the FSA CLU Program can be found at <https://www.fsa.usda.gov/>. More information about the NLCD can be found at <https://www.mrlc.gov/>.

Completeness_Report: The CSB covers the Continental United States.
Positional_Accuracy:
Horizontal_Positional_Accuracy:
Horizontal_Positional_Accuracy_Report:
The Crop Sequence Boundaries retain the positional accuracy of the historical Cropland Data Layer (CDL) inputs. The CDL uses Landsat 8 and 9 OLI/TIRS imagery that is obtained via download from the USGS Global Visualization Viewer <https://glovis.usgs.gov/> using the Collection 2 Level-1 specifications. Please reference the metadata on the Glovis website for the positional accuracy of the Landsat imagery. The CDL also uses Sentinel 2A and 2B imagery that is obtained via download from the Copernicus Open Access Hub

<https://scihub.copernicus.eu/> using the S2MSI1C product type which is orthorectified Top-of-Atmosphere reflectance. Please reference the metadata on the Copernicus website for positional accuracy details.

National railroads data layer used to assist in deriving field boundaries

Process_Step:
Process_Description:
The Crop Sequence Boundaries (CSB rev23) comprise multiple data layers covering 8-year windows derived from historical Cropland Data Layers (CDL). The CSB represents estimates of field boundaries, crop acreage, and crop rotations across the contiguous United States. It uses satellite imagery with other public data and does not contain personal identifying information. The boundaries captured are of crops grown only, not ownership boundaries or tax parcels (unit of property). The creation process is python-based with no manual drawing of field boundaries. The initial preprocessing steps include simplifying CDL category groupings, filtering noise, resampling to 10 meters, re-imposing road and rail network line data, and then stacking desired years. The resulting rasters are converted into polygons on a roughly county-sized subregion basis. Small polygons under 1 hectare with two or more years of crops within the 8-year windows are eliminated into the next largest neighboring polygon to remove islands within fields and to clean field edges. However, if the area is greater than 1 hectare, then only one year of cropland is required for the polygon to be kept. The resulting polygons are simplified to retain critical bends (Wang-Müller algorithm) at a 60 meter tolerance, then merged into a national database, and attribute tables populated. A cloud environment with many processors allows for faster completion of this step as each subregion can be spawned to a processor. These steps are repeated for the 8-year moving window to produce a unique layer of CSB history which currently includes the following time periods: 2008-2015, 2009-2016, 2010-2017, 2011-2018, 2012-2019, 2013-2020, 2014-2021, 2015-2022, 2016-2023, 2017-2024, and 2018-2025. The following link provides a more detailed description of the CSB creation.

Overview_Description:
Entity_and_Attribute_Overview:
The crop-specific categories present in the Crop Sequence Boundaries are derived from the USDA NASS Cropland Data Layer (CDL). The CDL is produced using agricultural training data from the Farm Service Agency (FSA) Common Land Unit (CLU) Program and non-agricultural training data from the most current version of the United States Geological Survey (USGS) National Land Cover Database (NLCD). Additional details about the CDL at available at <https://www.nass.usda.gov/Research_and_Science/Cropland/metadata/meta.php>.

Entity_and_Attribute_Detail_Citation:
Below are the Cropland Data Layer attributes which the CSB categories are derived from. If this table does not display properly, the original metadata can be viewed at <https://www.nass.usda.gov/Research_and_Science/Cropland/metadata/meta.php>.
